

Scenario 3 — Shopping Cart

✗ Weak: "Test the cart functionality."

What's missing: No add/remove/update actions, no price calculation validation, no coupon/discount scenarios, no out-of-stock handling.

I - Instruction:

Need to get the 20 test cases to test the Shopping Cart functionality in the ecommerce project which covers all positive and negative scenarios.

C - Context:

It is the e-commerce application similar to Amazon. The Shopping Cart feature allows users to add the products they want to purchase and manage the products before proceeding to checkout.

Constraints / Details:

- User can add a product to the shopping cart.
- User can add multiple different products to the cart.
- User can increase or decrease the quantity of a product.
- User can remove a product from the cart.
- Cart should display Product Name, Quantity, Unit Price and Total Price.
- Total price should be recalculated whenever product quantity is updated.
- User can apply valid coupon/discount codes.
- Invalid or expired coupon codes should be rejected with an appropriate error message.
- Discount amount should be calculated correctly in the final cart total.
- Out-of-stock products should not be allowed to proceed further for purchase.
- If a product becomes out of stock after being added to the cart, the user should be notified.
- Product price changes should be reflected correctly in the cart.
- Cart should not accept invalid quantities such as 0 or negative numbers.
- Cart should retain the added products when the user navigates to another page and returns to the cart.
- Empty cart scenario should be handled with an appropriate message.

E - Example:

Testcase Id | Description | TestSteps | Input | Precondition | Expected Output

001 | Add valid product to shopping cart | 1. Search for the product "Mobile Phone" 2. Select the product 3. Click "Add to Cart" | Mobile Phone | User landed on the product details page and product is available in stock | Product should be successfully added to the shopping cart and cart count should be updated

P - Persona:

Act as an Senior TestEngineer [Strict]

O - Output Format:

Need to get the output in the downloadable excel format with the columns:

Testcase Id | Description | TestSteps | Input | Precondition | Expected Output

Generate exactly 20 test cases covering positive and negative scenarios.

T - Tone:

Technical

Scenario 4 — Role-Based Access Control

 **Weak:** "Write test cases for user roles."

What's missing: No role types (Admin, Manager, Viewer), no permission matrix, no unauthorized access scenarios, no app domain.

I - Instruction:

Need to get the 20 test cases to test the Role-Based Access Control functionality which covers all positive and negative scenarios including authorized and unauthorized access.

C - Context:

It is an e-commerce application similar to Amazon. The application provides different access permissions based on the role assigned to the user.

Constraints / Details:

- Application supports three roles: Admin, Manager and Viewer.
- Admin has full access to the application.
- Admin can create, update and delete users.
- Admin can add, modify and remove products.
- Admin can view all orders and reports.
- Manager can add and update products.
- Manager can view and manage customer orders.
- Manager cannot create or delete application users.
- Viewer has read-only access.
- Viewer can view products and reports but cannot create, update or delete data.
- Users should see only the menus and features permitted for their role.
- Unauthorized features should be hidden or disabled.
- Users should not access restricted pages by directly entering the URL.
- Users should not access restricted functionality by modifying request parameters.
- Changing a user's role should immediately apply the corresponding permissions.
- Logged-out users should not be able to access protected pages.
- The system should display an appropriate Access Denied message for unauthorized access.

E - Example:

Testcase Id | Description | TestSteps | Input | Precondition | Expected Output

001 | Verify Admin access to User Management | 1. Login with Admin credentials 2. Navigate to User Management | Admin User | Valid Admin account should be available | Admin should successfully access User Management and Create, Update and Delete options should be displayed

P - Persona:

Act as an Senior TestEngineer [Strict]

O - Output Format:

Need to get the output in the downloadable excel format with the columns:

Testcase Id | Description | TestSteps | Input | Precondition | Expected Output

Generate exactly 20 test cases covering positive, negative and unauthorized access scenarios.

T - Tone:

Technical

Scenario 6 — Mobile App (OTP Login)

✗ Weak: "Test OTP login on mobile."

What's missing: No platform (Android/iOS), no OTP expiry time, no resend behavior, no network failure scenario, no Appium/device context.

I - Instruction:

Need to get the 20 test cases to test the OTP Login functionality in the mobile application which covers all positive and negative scenarios.

C - Context:

It is an e-commerce mobile application similar to Amazon available on Android and iOS. The application allows registered users to login using their registered mobile number and OTP.

Constraints / Details:

- Application supports Android and iOS platforms.
- User should enter a registered 10-digit mobile number.
- OTP should contain 6 numeric digits.
- OTP is valid for 2 minutes.
- Expired OTP should not be accepted.
- User can request a new OTP using Resend OTP.
- Resend OTP should be enabled after 30 seconds.
- When a new OTP is generated, the previous OTP should become invalid.
- Invalid OTP should display an appropriate error message.
- Blank OTP should not be accepted.
- OTP containing alphabets or special characters should not be accepted.

- User should be successfully logged in after entering a valid OTP.
- Unregistered mobile numbers should display an appropriate error message.
- Multiple incorrect OTP attempts should be handled securely.
- Network failure while requesting OTP should display an appropriate message.
- Network failure while validating OTP should not result in successful login.
- OTP should not be exposed in application logs.
- User should be able to request OTP through both Wi-Fi and mobile data.
- Mobile testing should cover both real devices and emulators/simulators.
- Appium can be used for mobile automation testing.

E - Example:

Testcase Id | Description | TestSteps | Input | Precondition | Expected Output

001 | Login using valid OTP | 1. Launch the mobile application 2. Enter registered mobile number 3. Click "Get OTP" 4. Enter valid 6-digit OTP 5. Click "Verify" | Registered Mobile Number + Valid OTP | User should have a registered account and active network connection | OTP should be successfully validated and user should be redirected to the application home page

P - Persona:

Act as an Senior Mobile TestEngineer [Strict]

O - Output Format:

Need to get the output in the downloadable excel format with the columns:

Testcase Id | Description | TestSteps | Input | Precondition | Expected Output

Generate exactly 20 test cases covering Android, iOS, positive, negative, OTP expiry, resend and network failure scenarios.
